

ATS Resume Analysis: Software QA Engineer

Overall Assessment:

Chandan S Gowda presents a highly accomplished resume with a strong background in software engineering, full-stack development, AI/ML solutions, and leadership. While the resume showcases impressive technical skills and project management capabilities, its primary focus is on software development rather than dedicated Quality Assurance. The candidate demonstrates some direct QA experience, particularly at Commvault, but the overall emphasis is misaligned with a pure Software QA Engineer role.

1. ATS Score: 68/100

Reasoning:

The resume scores reasonably well due to specific mentions of "manual test cases," "regression cycles," "validated key projects," "automating test cases," "reducing manual QA efforts," and interests like "Bug Bounty" and "vulnerability assessment." These terms directly align with several keywords and responsibilities in the job description. However, the score is not higher because key QA-specific actions like explicit bug *documentation*, *tracking*, *reporting* with reproduction steps, and familiarity with standard bug tracking tools (Jira, Trello) are not clearly articulated or are entirely missing. The overall profile also leans heavily towards development, which might dilute the QA focus for an ATS.

2. Resume Summary

Chandan S Gowda is a passionate and high-achieving Software Engineer with a strong academic background (9.3 CGPA in Computer Science) and experience spanning AI-driven solution development, full-stack application building, and project leadership. Currently a Software Engineer at Commvault, they have contributed to AI ecosystem development, automated VM workload test cases, validated key projects, and executed complex manual and regression testing cycles. Chandan also has experience as a Software Developer at HeyNox, a Full Stack App Developer for Google Summer of Code, and founded a digital solutions agency. Their diverse technical skill set includes Python, Flutter, Django, FastAPI, Langchain, MySQL, Git, GitHub, Selenium, and an understanding of Web Application Security.
